Project Tasks

Task 1	Network Design
Task 2	Initial Configurations
Task 3	VLANs and Inter-VLAN Routing Configuration
Task 4	OSPF, HTTP, HTTPs, DNS, and DHCP Configurations
Task 5	Network Security
Task 6	Network Testing

Task 1: Network Design

Network Number	Network Address	VLANs Config on	VLANs	Switch Ports
1	192.168.10.0/24	SW1	VLAN 1	-
			VLAN 10	Fa0/1, Fa0/2
			VLAN 11	Fa0/3, Fa0/4
	2001:db8:1:10::/64		Management VLAN (12)	VI1
			Native VLAN (13)	-

Task 2: Initial Configurations

A. Switches

1. Hostnames
2. Secret password "cisco"
3. Password "cisco" for console and vty lines
4. Enable password encryptions services
4. Banner "Auth Only"
5. Full-Duplex interfaces
6. Configure the interface speed

B. PC's

1. Hostnames
2. Full-Duplex interfaces
3. Configure interfaces ipv4 and ipv6 addresses
4. Configure ipv4 and ipv6 gateways
5. Configure the interface speed

C. Routers

1. Hostnames
2. secret password "DEPI"
3. Password "DEPI" for console and vty lines
4. Enable password encryption services
5. banner "Auth Only"
6. Full-Duplex interfaces
7. configure interfaces ipv4 and ipv6 addresses
8. configure ipv4 and ipv6 gateways
9. Configure the interface speed

D. Server

1. Hostnames
2. Full-Duplex interfaces
3. configure interfaces ipv4 and ipv6 addresses
4. configure ipv4 and ipv6 gateways
5. Configure the interface speed

Task 3: VLANs and Inter-VLAN Routing Configurations

SW1>

enable

configure terminal

vlan 1

ex

vlan 10

ex

vlan 11

ex

interface range fastEthernet 0/1-2

switchport mode access

switchport access vlan 10

ex

interface range fastEthernet 0/3-4

switchport mode access

switchport access vlan 11

ex

interface gigabitEthernet0/1

switchport mode trunk

ex

R1(config-if)#

```
interface gigabitEthernet 0/1.10
encapsulation dot1Q 10
ip address 192.168.10.1 255.255.255.192
ipv6 address 2001:db8:1:10::1/64
no shutdown
ex
interface gigabitEthernet 0/1.11
encapsulation dot1Q 11
ip address 192.168.10.129 255.255.255.192
ipv6 address 2001:db8:1:11::1/64
ipv6 address fe80::3 link-local
no shutdown
ex
interface g0/1.12
Encapsulation dot1Q 12
ip address 192.168.10.192 255.255.255.240
ipv6 address 2001:db8:1:12::1/64
ipv6 address fe80::4 link-local
no shutdown
```

SW2>

enable

configure terminal

Task 5: Network Security

Port Security

```
switchport port-security  
switchport mode access  
switchport port-security maximum 1 // 1 MAC ADDRESS
```

Access Control

```
access-list 100 deny ip 192.168.10.0 0.0.0.255 any  
access-list 100 permit ip any any  
interface GigabitEthernet0/1  
ip access-group 100 in
```

SSH

```
ip domain-name example.com  
username admin privilege 15 secret password123  
crypto key generate rsa //800 bit  
line vty 0 4  
transport input ssh  
login local  
exit
```

Report on the effectiveness of security measures

Introduction

In today's digital landscape, data privacy has emerged as a critical concern for individuals, businesses, and governments. The rapid expansion of data collection and processing has necessitated robust regulations to protect personal information from unauthorized use and breaches. Privacy regulations create a framework that upholds individuals' rights to control their data while ensuring organizations handle this information responsibly.

What Are Privacy Regulations?

Privacy regulations are legal frameworks that safeguard the collection, storage, and usage of personal information by organizations. These laws define how data should be managed, outlining individuals' rights over their information. Non-compliance can result in significant penalties, emphasizing the importance of adhering to these regulations.

Why Did We Use Access Controls and Port Security?

1. **Access Controls** Access controls are mechanisms that restrict access to resources within a computing environment. Their significance includes:
 - **Ensuring Data Confidentiality:** By limiting access to authorized users, sensitive information remains protected.
 - **Preventing Unauthorized Access:** Access controls establish rules that block unauthorized users from accessing critical network components.
 - **Improving Accountability:** User activities can be logged and monitored, allowing for the tracing of malicious actions.
 - **Reducing the Attack Surface:** Limiting user interactions with sensitive data decreases potential entry points for cyber threats.

2. **Port Security** Port security is a feature on network switches that controls access based on device MAC addresses. Its importance lies in:

- **Preventing Unauthorized Devices:** Ensuring that only approved devices connect to the network helps safeguard against infiltration.
- **Mitigating MAC Address Spoofing:** Port security can detect and block unauthorized MAC addresses.
- **Protecting Against Network Flooding Attacks:** Ports can shut down or restrict traffic in response to excessive MAC addresses, preventing network overload.
- **Enhancing Layer 2 Security:** By controlling device connections at the data link layer, port security adds an essential layer of defense.

Conclusion

Access controls and port security are fundamental components of network security. They work together to ensure that only authorized users and devices can access sensitive data, thereby maintaining confidentiality, integrity, and availability of information within the network.

Resources

(The Report was retrieved by ChatGPT 4o mini which in turn used the mentioned resources below)

1. Books:

- Stallings, William. *Network Security Essentials: Applications and Standards*. Pearson, 2019.

2. Reports:

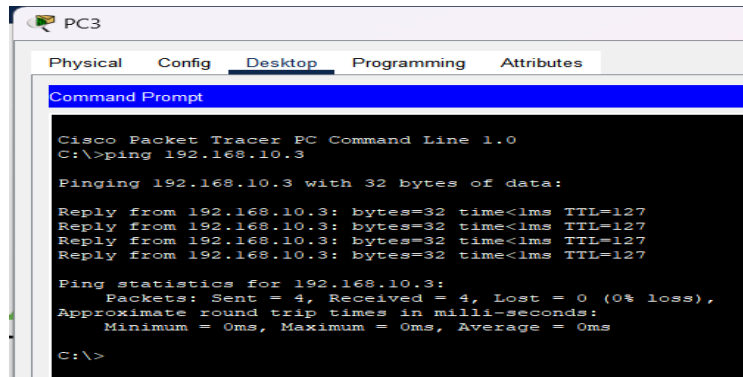

- National Institute of Standards and Technology (NIST). "NIST Privacy Framework: A Tool for Improving Privacy through Enterprise Risk Management." NIST, 2020. [NIST Privacy Framework](#)

Task 6: Network Testing

Connectivity Tests

1. Intra-VLAN Connectivity:

- All devices within the same VLAN are able to ping each other.

```
PC3
Physical Config Desktop Programming Attributes
Command Prompt

Cisco Packet Tracer PC Command Line 1.0
C:\>ping 192.168.10.3

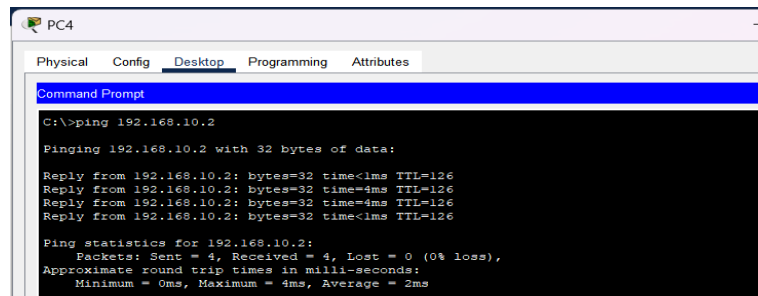

Pinging 192.168.10.3 with 32 bytes of data:

Reply from 192.168.10.3: bytes=32 time<1ms TTL=127
Reply from 192.168.10.3: bytes=32 time<1ms TTL=127
Reply from 192.168.10.3: bytes=32 time<1ms TTL=127
Reply from 192.168.10.3: bytes=32 time<1ms TTL=127

Ping statistics for 192.168.10.3:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms
C:\>
```

2. Inter-VLAN Connectivity:

- All devices across different VLANs are able to ping each other.

```
PC4
Physical Config Desktop Programming Attributes
Command Prompt

C:\>ping 192.168.10.2

Pinging 192.168.10.2 with 32 bytes of data:

Reply from 192.168.10.2: bytes=32 time<1ms TTL=126
Reply from 192.168.10.2: bytes=32 time=4ms TTL=126
Reply from 192.168.10.2: bytes=32 time=4ms TTL=126
Reply from 192.168.10.2: bytes=32 time<1ms TTL=126

Ping statistics for 192.168.10.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 4ms, Average = 2ms
```

3. Routing Across Routers:

- Routing is set and configured correctly across all the routers

The image displays three screenshots from the Cisco Packet Tracer application, illustrating network configuration and verification.

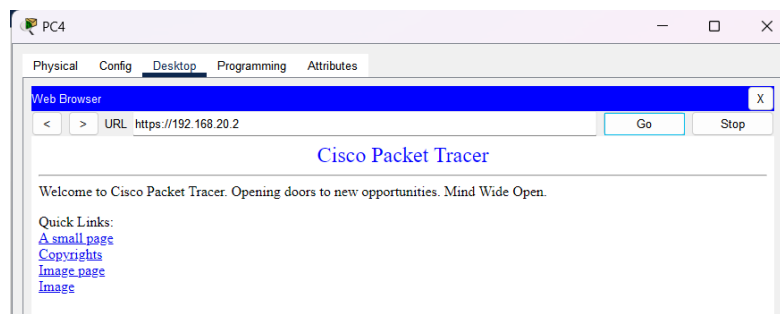

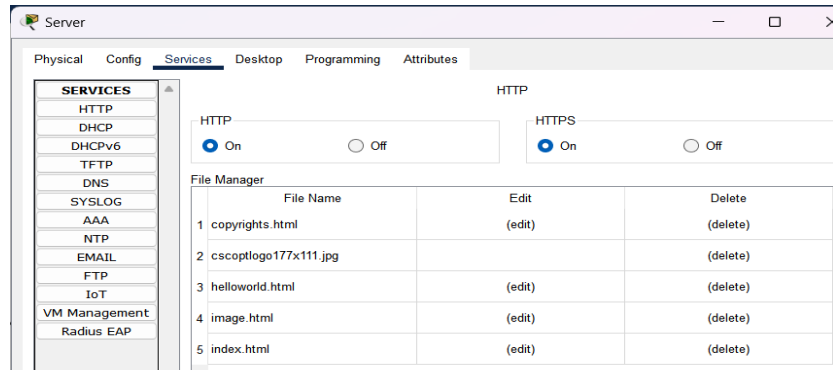

R1 Screenshot: Shows the CLI of Router R1. The command `R1>show ip route` is executed, displaying the routing table. The output shows various connected networks and static routes, including a summary for 192.168.10.0/24 and specific routes for 192.168.15.0/24 and 192.168.20.0/24.

R2 Screenshot: Shows the CLI of Router R2. The command `R2>show ip interface brief` is executed, displaying the status of the interfaces. The output shows that GigabitEthernet0/0, 1, 2, and 2.20 are all in the 'up' state.

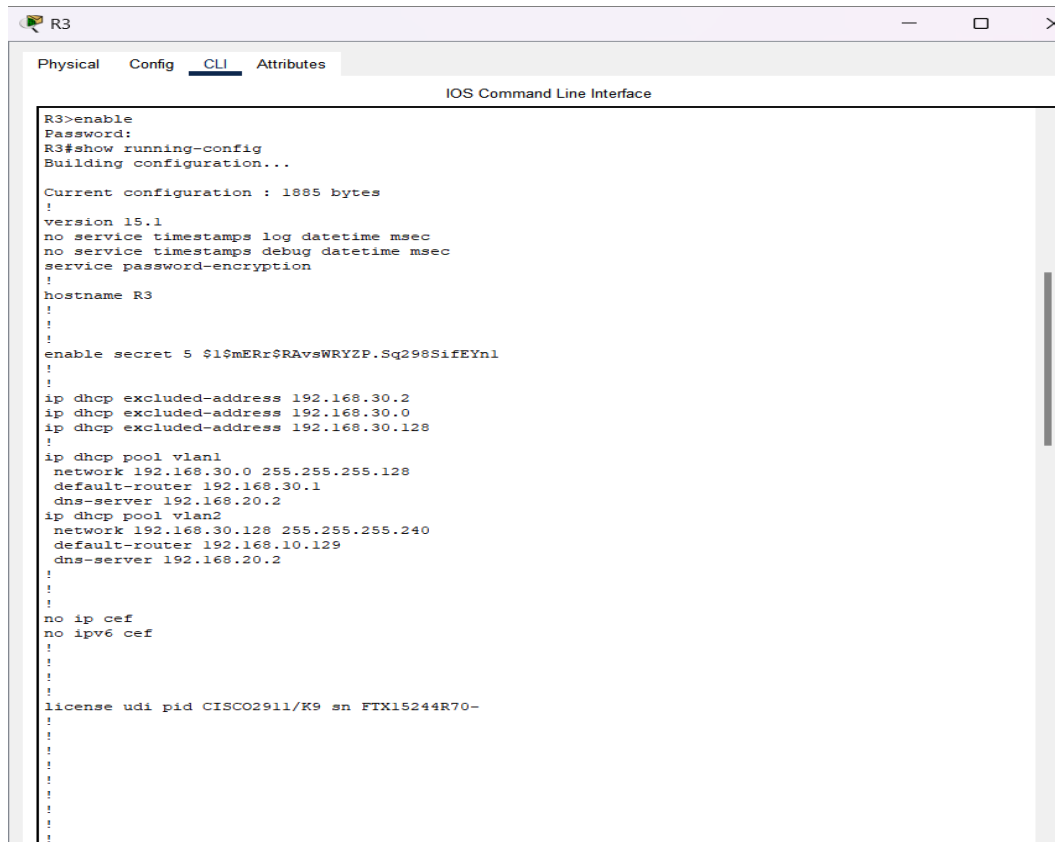

PC1 Screenshot: Shows the Command Prompt of PC1. The command `C:\>tracert 192.168.30.3` is executed, displaying the traceroute results. The output shows the path from PC1 to 192.168.30.3, passing through 192.168.10.1 and 192.168.15.6.

Functionality Test

- HTTPS service is enabled and functioning correctly

- DHCP:

The screenshot shows a terminal window titled 'R3' with tabs for 'Physical', 'Config', 'CLI', and 'Attributes'. The 'CLI' tab is active, displaying the 'IOS Command Line Interface'. The terminal output shows the following configuration:

```
R3>enable
Password:
R3#show running-config
Building configuration...

Current configuration : 1885 bytes

```

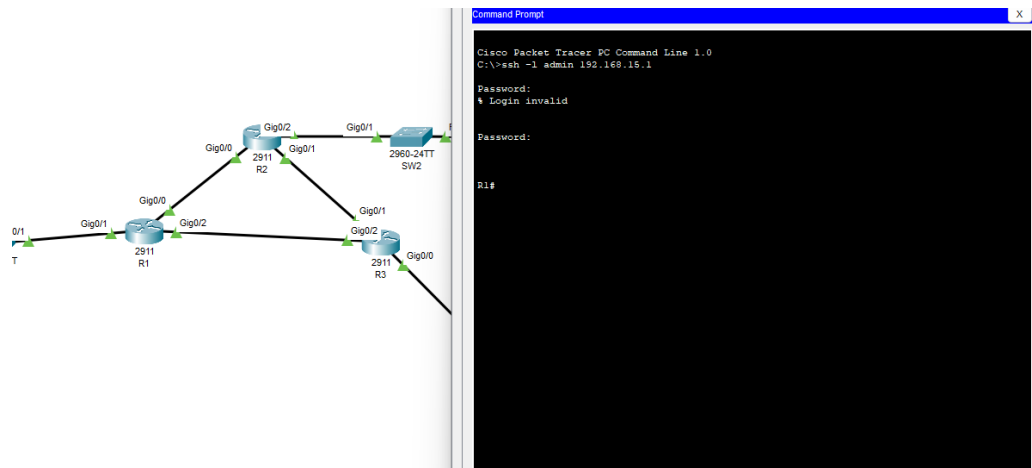

```
R3#show running-config | include dhcp
ip dhcp excluded-address 192.168.30.2
ip dhcp excluded-address 192.168.30.0
ip dhcp excluded-address 192.168.30.128
ip dhcp pool vlan1
ip dhcp pool vlan2
```

- DNS service

```
R3#show running-config | include dns
dns-server 192.168.20.2
dns-server 192.168.20.2
```

Security Tests:

- SSH is enabled and functioning

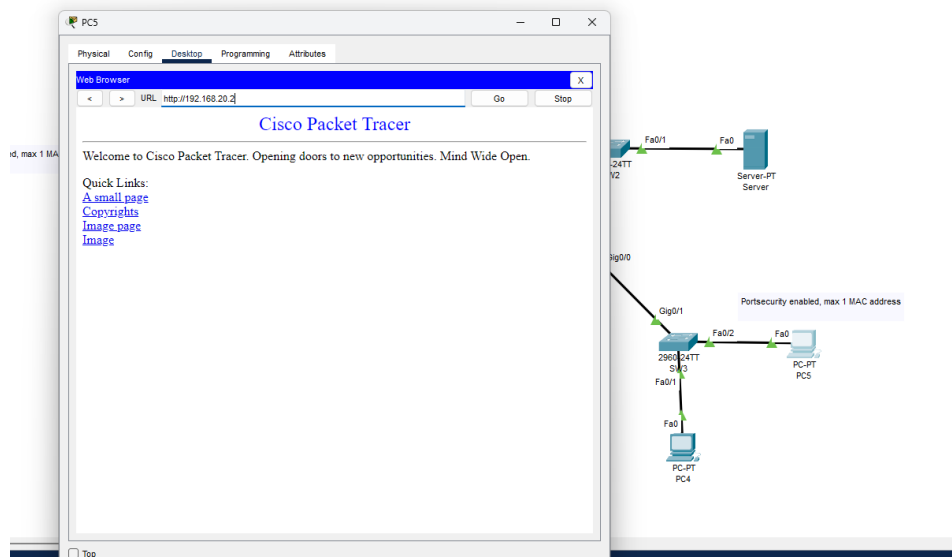

- Portsecurity is enabled and functioning

- ACL is enabled for and blocking devices on SW1 from accessing the server via HTTP

- Devices on SW3 can access the server via HTTP

Used commands:

Ping

Tracert

Nslookup

show ip route

configure terminal

ip route [destination network] [subnet mask] [next-hop IP or exit interface] → static routing

show ip interface brief

show access-lists

https://[Server IP address] → check connectivity to server

show running-config

show running-config | include dhcp

show ip dhcp pool

show ip dhcp binding

show ip dhcp server statistics

show port-security

ipconfig
